

CIVICCHAI

PS2 — AI-Based Citizen Grievance Classification,
Prioritization & Duplicate Complaint Detection

MASTER STANDARD OPERATING PROCEDURE

Two-Portal Product • AI • Telephony • Civic Social Layer • Government Dashboard •
Compliance

Tagline

“India mein har ek charcha Chai Pe hoti hai.”

Every complaint is a cup of tea.

How hot is the Chai? = How strongly does the community support the issue?
Version 2.0 | 01 September 2026 | India

1. Executive Definition

CivicChai is a civic grievance and social-participation platform. It gives citizens a simple way to file a civic problem through text, voice, smartphone, web or keypad-phone calling, then uses multilingual NLP/AI to classify the grievance, identify the responsible department and officer/office, calculate priority and trust signals, detect duplicates, generate an actionable report, and make the issue visible to the local community and authorized administration.

The two-portal architecture is mandatory: (1) Citizen Portal and (2) Government Administration Dashboard. They share a common backend, AI layer, document registry, jurisdiction registry and issue database, but have different permissions.

Core product loop

Speak or type → AI understands → duplicate check → citizen chooses existing/new → proof → report generated → department/officer/Hub mapped → community upvotes → Chai gets hotter → administration acts → status tracked → citizen/community verifies.

PS2 alignment

The platform directly addresses complaint intake, language normalization, classification, priority scoring, semantic similarity, duplicate detection, clustering, GIS/geographic hotspots, status tracking and analytics. The social layer adds a human/community signal to the PS2 prioritization requirement.

2. Portal Architecture

2.1 Portal A — Citizen Portal

The Citizen Portal is designed as a social civic app rather than a traditional government form. It should feel familiar to smartphone users while remaining usable for people with low bandwidth, low digital literacy and keypad phones.

Tab	Purpose	Core features
Home / Local Chai	Locality-based civic feed	Instagram-like feed; locality issues; comments; upvotes; follow; evidence; status badges.
■ File a Grievance	Primary creation action	Type, record voice, upload proof, capture photo/video, choose/confirm location, submit.
Chai Tapri	Trending civic issues	Top/hottest issues by locality/ward/PIN; ranking uses civic priority, not votes alone.
My Chai / Tracking	Citizen activity	Filed complaints, upvoted issues, followed issues, duplicate suggestions, status timeline.
Profile	Identity and controls	Profile, locality, notification settings, privacy controls, language, support and grievance history.

2.2 Portal B — Government Administration Dashboard

Module	Purpose	What admin sees
Overview	System-wide operating view	Open, assigned, in-progress, resolved, overdue, duplicate and high-priority counts.
Complaint Queue	Work allocation	Segregated by department, jurisdiction, category, priority, SLA, status.
Issue Detail	Full case record	Citizen report, evidence, AI classification, trust/priority factors, duplicate links, comments, documents, contact information.

Module	Purpose	What admin sees
Trending / Chai Heat	Community signal	Most supported civic issues and rising issues, with anti-manipulation indicators.
GIS / PIN Hubs	Geographic intelligence	PIN/locality/ward hubs, hotspots, issue density and department jurisdiction.
Reports & Analytics	Management intelligence	Department load, resolution times, repeat issues, duplicate ratio, hotspots, trends.
Officer / Hub Registry	Routing directory	Department, designated officer/office, public contact, hub address, jurisdiction and official documents.
Audit / Compliance	Governance	Status history, merges, overrides, moderation, model versions, access logs.

3. Citizen Portal — Detailed SOP

3.1 Locality-first experience

The citizen's Home feed should be anchored to a verified locality context. A QR code can map a physical location to a locality/PIN/ward identifier. The QR should not itself be treated as proof of residence. A citizen may confirm or change the service area subject to configured rules.

3.2 Complaint input modes

Mode	User action	System processing
Text	Citizen types in any supported language or mixed language	Language detection → normalization → NLP extraction → classification.
Voice on smartphone	Citizen records complaint	ASR/transcription → language detection → NLP → classification; original audio retained only if justified/consented.
Keypad phone	Citizen calls the CivicChai number	IVR/voice agent asks questions → speech/DTMF → structured grievance → confirmation.
Assisted filing	Operator/volunteer files on behalf of citizen	Record source and authorization/consent; distinguish assisted submission from self-submission.

Keypad-phone calling agent

The calling agent is a major accessibility feature. The objective is not merely to add a chatbot; it is to create a **voice-first grievance workflow** that works without smartphones or internet. The agent should confirm the final summary before submission and provide the complaint/document ID through voice/SMS/USSD where available.

Example call: “Namaste. Aapki shikayat kis baare mein hai?” → citizen speaks in Marathi/Hindi/English → agent asks location/PIN → asks whether they have proof → summarizes the complaint → “Kya yeh sahi hai?” → citizen confirms → issue is created and ID is read back.

4. The CivicChai Complaint Report — Major Differentiator

Every accepted grievance should produce a structured report page/document. This is the core artifact that converts an informal social post into an actionable civic record.

Report section	Required information
Document identity	CivicChai Document ID / Issue ID; created date/time; version; public/private visibility.
Complaint summary	Citizen's original complaint + AI-normalized summary; original language preserved.
Category	Department → category → subcategory → issue type; AI confidence and model version.
Priority	Priority score, severity, urgency, community support, persistence, geographic impact and evidence factors.
Trust / evidence	Trust score, evidence available, corroborating reports, confidence explanation; never treat trust as citizen worthiness.
Jurisdiction	PIN, locality, ward, municipality/district/state as applicable; exact coordinates restricted where needed.
Department	Responsible department; routing rule; official service/contact channel.
Officer / office	Officially published designated officer/role and public office contact details, only where authorized/published.
Hub	PIN-based hub name, hub address, phone/email/official contact, operating information if verified.
Legal / policy context	Relevant public law/rule/scheme/service standard from an official knowledge base, with source and disclaimer.
Official documents	Document IDs, circulars, SOPs, forms or notices published on CivicChai with source/authority and version.
Tracking	Timeline of submission, triage, assignment, action, status changes, authority notes and resolution evidence.
Community	Upvotes, comments, followers, corroborating reports and community verification.

Document publication model

CivicChai can host a public document page for each report and a controlled document registry for official reference documents. Official documents should preserve the issuing authority, document number, publication date, source URL, version and checksum/hash where technically appropriate. Do not imply that a CivicChai-hosted copy is itself the issuing authority's original record.

Example report header

CC-401208-2026-0001842 | Streetlight outage — Station Road
PIN: 401208 | Department: Municipal Public Lighting | Priority: 88/100 | Chai Heat: 92/100
Hub: [Verified local hub] | Official Contact: [Published office contact]
Status: Assigned | Last updated: 01 Sep 2026 14:10

5. Duplicate Complaint Engine

Duplicate handling is one of CivicChai's most important AI features. The objective is to prevent fragmented complaints without preventing citizens from reporting a genuinely different problem.

Required UX

“We found a similar complaint.”

Existing issue: “Station Road streetlights not working”

1,842 upvotes • 52 reports • Assigned

[Support this issue] [This is a different problem]

Never hard-block based only on AI similarity.

Signal	Use
Semantic similarity	Compare meaning, not only keywords.
Geographic proximity	Different cities/wards/PINs should not be merged merely because wording matches.
Category compatibility	Road pothole vs. water leak should not merge even if location is identical.
Time context	Recurring incidents may need separate reports or linked incidents.
Evidence similarity	Same photograph/near-identical evidence can strengthen duplicate suspicion.
Citizen decision	Citizen can join existing issue or declare a distinct issue.
Moderator/authority override	Merge/unmerge is reversible and audited.

Recommended similarity bands for pilot calibration

Similarity	Action
0.90–1.00	Strong duplicate suggestion; show existing issue prominently.
0.75–0.89	Related issue suggestion; do not auto-merge.
Below 0.75	Usually treat as distinct; continue normal workflow.

Thresholds are starting points only. Calibrate them using real multilingual pilot data and false-positive/false-negative evaluation.

6. Priority Score vs Trust Score

These two scores must remain separate. **Priority measures how urgently/collectively important an issue appears.** **Trust measures how much confidence the system has in the report's evidentiary quality.** Neither score should become a hidden ranking of citizens or a reason to suppress legitimate complaints.

6.1 Civic Priority — “How Hot is the Chai?”

Factor	Example weight	Meaning
Severity / urgency	25%	Potential safety, health, service disruption or public impact.
Community support	25%	Upvotes/corroborations, adjusted for manipulation.
Affected reports	15%	Number of distinct corroborating reports.
Persistence	10%	How long the issue remains unresolved.
Geographic concentration	10%	Hotspot density / locality impact.

Factor	Example weight	Meaning
Evidence quality	10%	Useful photos/videos/details, subject to verification.
Authority/SLA context	5%	Configured service priority or overdue condition where available.

Chai Heat = community/public support signal. It should be visually understandable but not the only factor used by administrators. A low-vote issue with high safety severity must not disappear.

6.2 Trust Score

Signal	Possible effect
Proof attached	Increases evidence confidence if valid/relevant.
Location consistency	Reported location matches selected area/evidence where available.
Corroboration	Independent users report the same condition.
Report consistency	Description, media and metadata are reasonably consistent.
Spam/anomaly signals	Repeated automated/abusive patterns reduce confidence.
Account history	May provide a limited integrity signal; must not become a social-credit score.

Trust must never mean “good citizen” or “bad citizen.” It should be a report/evidence confidence score. A low-trust complaint should still be accepted, logged and routed if it meets basic validity requirements.

7. Civic Education Layer

After a grievance is filed, CivicChai should teach the citizen what happens next. This is a core part of the product, not an optional FAQ.

Example citizen education card

Your complaint is classified as: Public street lighting
Responsible department: Municipal Public Lighting
Jurisdiction: PIN 401208 / Ward X
Official contact: Published municipal office contact
Local hub: Verified hub address
Reference: Official municipal service standard / applicable law or rule
Next step: Department acknowledgement → assignment → field action → resolution

Legal information is educational and does not constitute legal advice.

Legal-information engine governance

- Use an authority-controlled knowledge base with source URL, document ID, issuing authority, effective date and version.
- Never let a general-purpose LLM invent a law, section, officer or government contact.
- Use retrieval-augmented generation (RAG) against verified documents for legal/service explanations.
- Display the source document and publication date alongside important legal claims.
- If no verified legal basis is found, say so instead of guessing.
- Officer information should be limited to officially published professional contact details; do not expose private personal information.

8. AI Architecture — NLP + WebLLM + Online AI

CivicChai should use a layered AI architecture rather than sending every request to a cloud model. The objective is privacy, lower latency, offline resilience and cost control.

Task	Offline/WebLLM	Online AI	Rule
Language detection	Yes	Optional	Prefer local for simple detection.
Basic normalization	Yes	Yes	Preserve original text.
Classification	Yes for supported taxonomy	Yes for complex cases	Store confidence/model version.
Duplicate retrieval	Local cache + local index where feasible	Vector DB/server	Always use geo/category constraints.
Legal explanation	Cached verified snippets only	RAG over verified authority corpus	Never free-generate legal citations.
Priority calculation	Deterministic local code	No need unless policy changes	Score should be reproducible.
Trust score	Deterministic rules	Optional AI anomaly signal	Do not make opaque citizen ranking.

Task	Offline/WebLLM	Online AI	Rule
Voice transcription	Browser/device if available	Cloud ASR fallback	Inform users about processing.

WebLLM operating principle

WebLLM can execute compatible language models in the browser using local device resources. CivicChai should treat this as a capability layer, not a promise that every device can run every model. On weak devices, the platform should gracefully fall back to lightweight server inference or non-AI workflows.

Caching strategy

- Cache locality metadata, taxonomy, department mappings, public hub contacts and verified education snippets.
- Cache common classification patterns and compact models where technically appropriate.
- Do not cache sensitive personal data in browser storage unless strictly necessary and protected.
- Use versioned cache manifests so outdated officer contacts/laws are not silently presented as current.
- When offline, allow drafting/recording where possible; mark submission as pending until a secure connection is available.

9. Calling Agent / Keypad Phone SOP

CivicChai should support citizens who do not have smartphones. The voice channel should create the same structured issue record as the smartphone/web portal.

Important safeguards

- Always read the final complaint summary back to the caller before submission.

- Provide a simple mechanism to correct the AI transcription.
- Clearly announce recording/processing practices where legally required.
- Avoid collecting unnecessary sensitive personal information through voice.
- Use DTMF fallbacks for essential steps so a caller can proceed when speech recognition fails.
- Do not make the phone channel dependent on a smartphone app.

10. Shared Backend & Data Architecture

Core entity	Important fields
User	user_id, language, locality, contact, consent/preferences, role.
Locality / Hub	locality_id, PIN, ward, authority, hub address, official contact, source/version.
Issue	issue_id, document_id, title, original_text, normalized_text, category, department, location, status.
Report	report_id, issue_id, reporter reference, source channel, evidence, created_at.
Priority	score, factor values, scoring version, timestamp.
Trust	confidence score, evidence factors, anomaly flags, scoring version.
Duplicate link	issue_a, issue_b, similarity, model/version, decision, actor.
Official contact	department, officer role/name where public, office phone/email, source, verified_at.
Official document	document_id, title, issuer, publication date, effective date, source URL, version, checksum.
Status event	issue_id, old/new status, actor, timestamp, note/evidence.
Audit event	actor, action, object, timestamp, IP/device where justified, before/after.

11. Complaint Lifecycle & Tracking

Tracking page example

CC-401208-2026-0001842
Filed: 01 Sep 2026, 10:02
AI classified: 10:02
Duplicate check: 10:02 — existing issue suggested; citizen joined
Department assigned: 10:08
Officer/office acknowledged: 13:20
In progress: 02 Sep 2026
Resolution evidence: 04 Sep 2026
Citizen verification: Pending

SLA / escalation

Where an authority provides a service-level target, CivicChai should display the configured target and aging status. Do not invent an SLA. Escalation should follow the authority's official hierarchy or grievance mechanism. CivicChai can educate and guide citizens but should not represent itself as the statutory appellate authority unless legally authorized.

12. Government Dashboard — Detailed SOP

The government dashboard should be simple, generalized and operational. It is not intended to reproduce the social feed in full; it should turn the feed into structured administrative work.

12.1 Dashboard home

Card	Metric
Total issues	All active + closed in selected jurisdiction.
High priority	Priority above configured threshold.
Overdue	Issues beyond configured service target.
Unassigned	Accepted issues without department/owner.
Duplicate reduction	Reports consolidated into canonical issues.
Hottest Chai	Top community-supported issues.
Rising Chai	Fastest-growing issues, not simply largest.
Hotspots	Geographic concentration by category.

12.2 Segregation filters

- State → district → municipality → ward → PIN/locality.
- Department → category → subcategory.
- Priority → trust → status → SLA age.
- Date range → new → rising → unresolved → resolved.
- Source channel → smartphone → web → voice → assisted.

12.3 Issue detail for administrators

Section	Admin view
Citizen submission	Original text/audio/transcript; source channel; evidence; privacy-controlled identity.
AI analysis	Category, department, confidence, duplicate candidates, priority/trust factors, model versions.
Jurisdiction	PIN, ward, hub, responsible department and routing source.
Officer/office	Officially published officer/role/contact; no private data.
Legal/education	Verified public reference documents and explanatory content.
Community	Votes, comments, corroboration, abuse/moderation flags.
Action	Assign, update status, add official note/evidence, merge/unmerge with audit.

13. Chai Tapri — Trending Issues

Chai Tapri is the civic equivalent of a trending page. It should answer: **“What is the community talking about right now?”** while avoiding a simple popularity contest.

Ranking signal	Purpose
Current Chai Heat	Community support.
Rate of growth	Detect rapidly emerging problems.
Priority	Prevent low-severity viral posts from dominating urgent issues.
Geographic impact	Locality/ward concentration.
Distinct corroboration	Independent reports rather than repeated bot activity.
Recency	Avoid permanently locking the feed to old issues.

GIS hotspot model

Public map privacy

Exact home addresses or precise locations should not automatically be exposed publicly. The public map should use appropriate geographic generalization, while authorized officials may receive finer-grained information when necessary.

14. India Compliance & Legal Readiness

This section is a compliance-readiness blueprint, not a legal opinion. Final production deployment should be reviewed by qualified Indian counsel and, where applicable, the participating government authority. Laws, rules and government guidance can change.

14.1 DPDP Act, 2023 + DPDP Rules, 2025

CivicChai processes digital personal data through accounts, contact details, voice recordings/transcripts, comments, location and administrative workflow. The Digital Personal Data Protection Act, 2023 provides the core Indian framework for processing digital personal data. MeitY published the Digital Personal Data Protection Rules, 2025 on 14 November 2025, along with an enforcement timeline and related notifications. The product should therefore be designed for the applicable provisions and commencement dates at launch rather than assuming all provisions operate on one date.

Area	CivicChai control
Purpose / necessity	Collect only what is required to file, route, track, secure and improve civic complaints.
Notice	Layered privacy notice before/at collection; explain voice, location, evidence and public visibility.
Processing basis	Document the applicable legal basis for each processing purpose; do not assume consent is the only basis.
Data principal rights	Create workflows for applicable access, correction, erasure, grievance and other rights.
Children	Use age-appropriate safeguards and avoid unnecessary collection of children's data.
Security	Encryption, access control, logging, backups, secrets management and incident response.
Retention	Purpose-based retention schedule; delete/anonymize when no longer required, subject to applicable legal/authority needs.
Breach	Maintain a documented incident-response and notification process applicable to the platform's role.
Vendors	Map cloud, AI, ASR, telephony and analytics vendors; contract and security review as appropriate.

14.2 IT Rules 2021 / intermediary readiness

Because CivicChai hosts user-generated posts, comments, images and videos, counsel should assess the platform's status under the Information Technology (Intermediary Guidelines and Digital Media Ethics Code) Rules, 2021 and any amendments in force at launch. MeitY's current materials show updates to the IT Rules in February 2026 and further draft amendments in 2026, so the production compliance matrix must be date/version controlled.

Control	Requirement
Terms & community rules	Publish acceptable-use and civic-discussion rules.
Content reporting	Provide user-facing reporting for unlawful/abusive content.
Grievance handling	Maintain the applicable grievance contact/process and records.
Moderation	Document removal/restriction criteria; do not suppress good-faith criticism merely because it is critical.
Legal notices	Process valid notices through authorized/legal workflow; preserve audit history.
Account security	Protect accounts and admin access; publish relevant security guidance.

14.3 CERT-In cyber security directions

CERT-In's directions dated 28 April 2022 cover cyber-security practices, prevention, response and reporting. The official CERT-In FAQ states that covered reportable cyber incidents should be reported within the stipulated six-hour period, with available information first and additional information later where needed. CivicChai should therefore maintain an incident response function, log preservation and escalation matrix.

14.4 Accessibility / RPwD

The Rights of Persons with Disabilities Act, 2016 includes provisions on accessibility and access to information and communication technology. CivicChai should provide keyboard navigation, screen-reader labels, captions/transcripts, accessible forms, scalable text and non-color-only status indicators. Voice and keypad channels further improve access.

15. Security, Privacy & Trust Controls

Risk	Control
QR spoofing	Signed/verified QR mapping; official domain; periodic physical QR audits.
Fake government contacts	Only publish contacts from verified authority registry with source and verification date.
Vote manipulation	One active vote/account/issue; rate limits; anomaly detection; bot resistance.
Trust manipulation	Trust score cannot be directly bought, gamed or used as a citizen reputation score.
Doxxing	PII detection/redaction; restrict exact addresses and private contact details.
Voice privacy	Minimize recording retention; disclose processing; protect transcripts/audio.
Prompt injection	Treat all citizen content as untrusted; isolate tools and retrieval context.
AI hallucination	Verified knowledge base; confidence thresholds; human fallback.
Document tampering	Versioning, access control, checksums and source metadata.
Admin compromise	MFA, RBAC, least privilege, privileged access review, audit logs.
Malicious uploads	File type validation, malware scanning, re-encoding and isolated storage.

15.1 Role-based access control

Role	Access
Citizen	Own profile, own reports, public issues, votes/comments, tracking.
Moderator	Content moderation and limited user/report controls; no unnecessary government data.
Department operator	Issues routed to department/jurisdiction; status/action fields.
Department supervisor	Department analytics, assignment, escalations, overrides.
Authority administrator	Cross-department jurisdiction view according to authorization.
System administrator	Technical administration; should not automatically have unrestricted civic-content access.
Auditor	Read-only audit/compliance data as authorized.

16. Testing & Acceptance Criteria

Test	Acceptance criterion
Multilingual classification	Hindi, Marathi, English and code-mixed examples classify into the correct taxonomy at agreed pilot accuracy.
Voice filing	Caller can complete complaint creation without smartphone; final summary is confirmed.
Keypad fallback	Essential steps can be completed with DTMF when speech recognition fails.
Duplicate detection	Known duplicate pairs are surfaced; hard negatives are not routinely merged.
Geographic safety	Same wording in different locations does not automatically become one issue.
Report generation	Every accepted complaint receives stable issue/document ID and structured report.
Officer/hub accuracy	Contacts are pulled from verified registry with source/version.
Legal education	No unsourced law/officer claims; every legal reference has a source.
Offline mode	Supported local features work without network; pending submissions are clearly marked.
Admin dashboard	Filtering, segregation, tracking and analytics match database records.
Security	No critical vulnerabilities before public pilot.
Accessibility	Critical journeys pass keyboard, screen-reader and contrast checks.
Auditability	Sensitive actions have actor, timestamp, before/after and model version where applicable.

17. KPIs & Success Metrics

Metric	Why it matters
Duplicate suggestion precision	Measures whether suggested existing issues are actually relevant.
Duplicate reduction	Measures fragmentation reduction.
Classification F1 / accuracy	Measures AI category quality across languages.
Department routing accuracy	Measures operational correctness.
Median time to acknowledgement	Measures citizen responsiveness.
Median time to assignment	Measures routing performance.
Resolution time	Measures actual civic outcome.
Chai Heat integrity	Measures resistance to bot/coordination manipulation.
Evidence-backed issue rate	Measures actionability.
Trust calibration	Checks whether high-trust reports are actually more reliable without suppressing low-trust reports.
Education engagement	Tracks whether citizens view department/law/hub information.
Offline completion rate	Measures accessibility for low-connectivity users.

18. 401208 Pilot Scenario — Full Walkthrough

Scenario: A citizen in PIN 401208 sees a broken streetlight near a road. The citizen uses the CivicChai smartphone portal or calls from a keypad phone.

Step	Citizen experience	Backend/admin outcome
1	Opens Home / scans locality QR	PIN/locality context resolved.
2	Taps + or calls	Input channel recorded.
3	Speaks: “15 din se Station Road ki lights band hain”	ASR/transcript + language detection.
4	Adds photo	Evidence stored with access controls.
5	AI classifies	Public Lighting → streetlight outage.

Step	Citizen experience	Backend/admin outcome
6	Duplicate found	Existing issue shown; citizen chooses Upvote/Join.
7	If distinct	New canonical issue created.
8	Report generated	Document ID + department + verified hub/contact + education card.
9	Community supports	Chai Heat rises based on valid votes/corroboration.
10	Admin sees queue	Issue appears under Public Lighting / PIN 401208.
11	Officer/office acts	Status becomes Assigned/In Progress.
12	Resolution uploaded	Citizen receives update; community can verify.

19. MVP / Hackathon Build Plan

Phase	Build
Phase 1	Citizen portal shell: Home, Chai Tapri, + complaint creation, tracking, profile.
Phase 2	Multilingual text/voice intake, NLP classification, department routing and structured report.
Phase 3	Duplicate detection + upvote existing issue + Chai Heat + trust/evidence model.
Phase 4	Government dashboard: queue, segregation, issue detail, tracking, analytics.
Phase 5	Hub/officer/document registry + civic education cards + GIS hotspots.
Phase 6	WebLLM/local inference + caching + offline drafting + keypad-phone voice agent.
Hardening	Security, moderation, accessibility, audit logs, legal review, performance and model evaluation.

20. Recommended MVP Screen Map

Citizen	Government
Home — Local Chai	Dashboard — Overview
Complaint Composer	Complaint Queue
Voice Complaint	Issue Detail
Duplicate Suggestion	Department View
Complaint Report	Officer/Hub Registry
Chai Tapri — Trending	GIS / Hotspots
My Complaints / Tracking	Reports & Analytics
Upvoted Issues	Audit / Compliance
Profile / Settings	Knowledge / Documents

21. AI Governance & Human Oversight

- Every AI classification, duplicate suggestion and trust/priority decision must have a model/rules version.
- Low-confidence cases should fall back to manual review or a general queue.
- The original citizen input must remain available; AI normalization must not overwrite it.
- AI should recommend department/officer routing; final administrative responsibility remains with authorized officials.
- Legal education should use retrieval from verified official documents rather than free-form model memory.
- Measure errors separately by language and input mode.
- Audit whether high engagement systematically crowds out severe but low-visibility problems.
- Provide correction, dispute and appeal mechanisms for duplicate matches and moderation decisions.

22. Pre-Launch Compliance Checklist

- ■ Legal entity, authority partnership and data-controller/processor roles documented.
- ■ Privacy notice finalized and mapped to actual collection flows.
- ■ Processing purposes and legal bases documented.
- ■ Data inventory covers profile, voice, transcript, location, evidence, comments, votes and admin data.
- ■ Rights/grievance workflow implemented.
- ■ Retention/deletion schedule approved.
- ■ DPDP Act/Rules applicability and commencement dates re-checked at launch.

- ■ IT Rules/intermediary assessment completed for user-generated content.
- ■ Community standards, moderation and appeal workflow published.
- ■ CERT-In incident response and reporting workflow established.
- ■ Security assessment/penetration testing completed.
- ■ Officer/hub contacts verified and source-versioned.
- ■ Official documents have issuer, ID, publication/effective date and source.
- ■ Legal education content has citations/source links and disclaimer.
- ■ Accessibility testing completed.
- ■ Voice/keypad flow tested for consent, correction and confirmation.
- ■ AI model evaluation completed for multilingual classification and duplicate detection.
- ■ Trust score reviewed for fairness and non-suppression.
- ■ Public location display reviewed for privacy risk.
- ■ Government dashboard RBAC and admin audit logging enabled.

23. Official Legal / Policy Reference Register

The following official sources were checked for this SOP. The production legal register should record the exact version/date reviewed and be re-checked before deployment.

Reference	Official source / note
Digital Personal Data Protection Act, 2023	India Code — Act No. 22 of 2023. https://www.indiacode.nic.in/indiacode/handle/123456789/22037
Digital Personal Data Protection Rules, 2025	MeitY — notified 14 Nov 2025; includes enforcement timeline and Board-related notifications. https://www.meity.gov.in/documents/act-and-policies/digital-personal-data-protection-rules-2025-gDOxUjMtQWa
IT Rules, 2021	MeitY — current page states updated 10 Feb 2026; check latest consolidated version at deployment. https://www.meity.gov.in/documents/act-and-policies/information-technology-intermediary-guidelines-and-digital-media-ethics-code-rules-2021-it-rules-2021-ljM5QjMtQWa

Important date/version note

MeitY's IT Rules page currently identifies an updated 10 February 2026 version, and MeitY also lists 2026 draft amendment materials. CivicChai should lock a legal baseline by launch date and monitor official notifications rather than relying on a static document forever.

24. Final CivicChai Product Statement

“India mein har ek charcha Chai Pe hoti hai.”

CivicChai turns that cultural idea into a civic operating system: every local problem becomes a “cup of tea”; citizens discuss it, support it and add proof; AI structures it; duplicates become one collective issue; the Chai gets hotter as credible community support grows; and the administration receives a clean, trackable, department-routed record.

Positioning for PS2: CivicChai is not merely a complaint form and not merely a social network. It is an AI-powered civic grievance intelligence platform with a social participation layer, built around classification, prioritization, duplicate detection, routing, education, evidence and transparent tracking.

Legal disclaimer: This SOP is a product and compliance-readiness document. It does not constitute legal advice, a statutory grievance mechanism, or a guarantee that any government department/officer will act within a particular time. Final legal, procurement, privacy, accessibility and government-integration requirements must be confirmed for the specific jurisdiction and deployment.
